## Second order differential eqn.

$M(tx, ty) = t^\alpha M(x,y)$

Homogeneous function

Homogenous eqn → A Linear $n^{th}$ order DE of the form

$$\rightarrow \quad a_n(x)\frac{d^n y}{dx^n} + a_{n-1}(x)\frac{d^{n-1}(y)}{dx^{n-1}} + ----$$

$$a_1(x)\frac{dy}{dx} + a_0 y = 0 \quad —— ⑥$$

is homogeneous

where as

$$\rightarrow \quad a_n(x)\frac{d^n y}{dx^n} + a_{n-1}(x)\frac{d^{n-1} y}{dx^{n-1}} + --- a_1(x)\frac{dy}{dx}$$

$$+ a_0 y = g(x)$$

$$g(x) \neq 0 \quad —— ⑦$$

is non-homogeneous

$a_i(x), g(x)$ continuous and $a_n \neq 0$ for every $x$.

ex $3y''' + 2y'' + 6x = 0$ Non-homogeneous
$3y''' + 2y'' + 6y = 0$ homogeneous.

SUPERposition principle Homogeneous eqn.

let $y_1, y_2, ---- y_k$ be soln of homogenous eqn (6) on I, then the linear combination

$$y = c_1 y_1(x) + c_2 y_2(x) + ---- + c_k y_k(x)$$

where $c_1, c_2 ---- c_k$ are constants, is also a soln on the interval.

Proof $K = 2$

Let $\overset{\textcircled{6}}{y_1}, \overset{\textcircled{6}}{y_2}$ are soln.

$\overset{\textcircled{6}}{c_1 y_1 + c_2 y_2}$ is also soln.

Hence proved.

ex The function $y_1 = x^2$, $y_2 = x^2 \ln x$ are both soln, of ODE

$$x^3 y''' - 2xy' + 4y = 0$$ on

$(0, \infty)$. Then by superposition principle

i.e. $y = c_1 x^2 + c_2 x^2 \ln(x)$ is also a soln.

ex $f_1(x) = \sin x$, $f_2(x) = \sin x \cos x$

LD or LI.

LD ↓ Linearly Dependent

LI → Linearly Independent

Wrounsicion Suppose each of the function $f_1(x), f_2(x) ---, f_n(x)$ posses atleast $n-1$ derivatives. The determinant

$$W(f_1, f_2 --- f_n) = \begin{vmatrix} f_1 & f_2 & ---- & f_n \\ f_1' & f_2' & ---- & f_n' \\ \vdots & \vdots & & \vdots \\ f_1^{n-1} & f_2^{n-1} & & f_n^{n-1} \end{vmatrix}$$

is called wronskion

if $y_1, y_2 --- y_n$ are soln, of homogeneous linear Dependent on I, they they are LI iff $W(y_1, y_2 -- y_n) \neq 0$.

Lemma 1 if $y_1(x)$ and $y_2(x)$ are two soln of $y'' + p(x)y' + Q(x)y = 0$ on $[a, b]$, there their $W = w(y_1, y_2)$ is either identically zero or never zero.

eg $f(t) = t^3$

$$g(t) = |t|^3 = \begin{cases} t^3 & t > 0 \\ -t^3 & t < 0 \end{cases}$$

If $t > 0$

$$W(f, g) = \begin{vmatrix} t^3 & t^3 \\ 3t^2 & 3t^2 \end{vmatrix}$$

$$= 0$$

If $t < 0$ $W(f, g) = 0$

$\Rightarrow W = 0$

But $f(t)$ and $g(t)$ are LD.

$f(t) = c\,g(t)$. on $(-\infty, \infty)$

either on $(-\infty, 0)$, on $(0, \infty)$

they are LI $\forall\, t \in (-\infty, \infty)$ because we ~~do cant f~~ cann't find a such c'

⇒ These never be soln of homogeneous eqn.

ex let $f(x) = x|x|$
$g(x) = x^2$.

**Theoram**

If f and g be any two differentiable function on I. ~~If~~ $W(x) = 0$ for atleast one ~~x =~~ $x \in I$ then f, g are LI on I.

$g, f \ (a,b) \to R$

or if f and g ~~are~~ are LI on I
then $w(~~x~~) \neq$, ~~[illegible]~~ $\angle R$
[$\exists x$ ]

## Fundamental set of soln

Any set $y_1, y_2 - - - y_n$ of n L.I. soln of homo $n^{th}$ order linear one is called

Th ~~existance from of fundamental d.set~~

There always exist a fundamental set for
L-H-$n^{th}$ order.

Def General soln of homo eqn

If $y_1, y_2, \dots, y_n$ forms a fundamentul set of soln then

$$y = c_1 y_1 + c_2 y_2 + \cdots + c_n y_n$$

where $c_i$'s are constants is a general soln

**ex** $y'' - 9y = 0$, $y_1(x) = e^{3x}$
$y_2(x) = e^{-3x}$
are soln.

$$y = c_1 y_1 + c_2 y_2$$

**Non- homogeneous eqn**

$$a_n(x)\frac{d^n y}{dx^n} + a_{n-1}(x)\frac{d^{n-1} y}{dx^{n-1}} + \cdots a_0(x) y = g(x)$$

$$g(x) \neq 0$$

**Particular solution**

Any function (any soltn) $y_p$ free of arbitrary parameters.

**Thm** **General solution**
Let $y_p$ be particular solution of ⑦ (NHLDE) on I. Let
$y_1, y_2 \cdots y_n$ be fundamental set of soln, of associated homo eqn then

general soln of ⑦ on I is

$$y = \underbrace{c_1y_1 + c_2y_2 + \cdots c_ny_n}_{} + y_p$$

$c_i$ → arbitiary constants.

$$\underset{\downarrow \text{operator.}}{\mathcal{L}}(y) = g(x)$$

complementary function (soln)

$$y = y_c + y_p$$

**Thm** Superposition principle.

Suppose $y_{p_i}$ denotes particular soln of corresponding DE.

$$a_ny^n + a_{n-1}y^{n-1} + \cdots a_ny = g_i(x)$$

$$i = 1, 2, \cdots K$$

then $y_p = y_{p_1}(x) + y_{p_2}(x) + \cdots y_{p_k}(x)$ is particular solution of

$$a_ny^n + a_{n-1}y^{n-1} + \cdots a_0y = g_1(x) + g_2(x) + \cdots g_k(x)$$

## Reduction of order

General second ODE → $F(x, y, y', y'') = 0$

we consider two special types of ~~sec~~ second ODE.

I) Dependent variable is missing.

y is not explicit present, then eqn can be written as.

$$F(x, y', y'') = 0$$

then, we substitute

$y' = p, \quad y'' = \frac{dp}{dx}$

$F(x, p, p') = 0$

ex

$xy'' + y' = 4x$

$y'' = p_x \,, \; y' = p$

$xp' + p = 4x$

$\Rightarrow \quad \frac{dp}{dx} + \frac{p}{x} = 4$

$e^{\int 1/x \, dx} = x$

$px = 2x^2 + c$

$\frac{dy}{dx} = 2x + \frac{c}{x}$

$\boxed{y = x^2 + c_1 \ln x + c_2}$

II) Independent variable is missing.

$F(y, y', y'') = 0$

$y' = p, \quad \frac{dy}{dx} = p$

$\frac{d^2y}{dx^2} = \frac{dp}{dy} \frac{dy}{dx}$

$= p \frac{dp}{dy}$

$$F\left(y, P, \frac{dP}{dy}\right) = 0.$$

ex

$$y'' + K^2 y = 0$$

ex

$$y\,y'' + (y')^2 = 0$$

$$y\,\cancel{P}\frac{dP}{dy} + P^{\cancel{2}} = 0$$

$$\int -\frac{dP}{P} = \int \frac{dy}{y}$$

$$-\ln P = \ln y + c$$

$$\ln Py = c$$

$$\int y\frac{dy}{dx} = \int e^c$$

$$\frac{y^2}{2} = x e^c + c_2$$
